The contestant is told to match the cards, but not how to match: however, they are told if a particular game is right or wrong. Similarly, test results can be misleading after testing the same person for a long period of time. Figures on the cards differ in colour, quantity, and shape.[5] Psychological tests such as WCST, given alone, cannot be used to measure the effects of a frontal lobe injury, or the aspects of cognitive function it may affect, such as working memory; several tests must be used.[citation required] may be good at a task but show dysfunction in the executive function in general. When administered, WCST allows the physician to speculate on the following functions of the "frontal" lobe: strategic planning, organised research, use of environmental feedback to shift cognitive sets, direct behaviour towards achieving a goal, and modulate the impulsive response.
